ECC006 Homework Assignment #7

1. How would you link to the named fragment #jobs on the page employ.html from the home page of the site?
a. <a href="employ.html#jobs">Jobs</a>
b. <a name="employ.html#jobs">Jobs</a>
c. <a link="employ.html#jobs">Jobs</a>
d. <a href="#jobs">Jobs</a>

2. Which pseudo-element can be used to generate content that precedes an element?
a. :after
b. :before
c. :content
d. :first-line

3. Which of the following is a mobile web design best practice?
a. Configure a multiple-column page layout.
b. Avoid using lists to organize information.
c. Configure a single-column page layout.
d. Embed text in images wherever possible.

4. Find the Error. The page below is intended for the navigation area to display on the right side of the browser window. What needs to be changed to make this happen?

```
<!DOCTYPE html>
<html lang="en">
<head>
<title>Find the Error</title>
<meta charset="utf-8">
<style>
body { background-color: #d5edb3;
color: #000066;
font-family: Verdana, Arial, sans-serif; }
nav { float: left;
width: 120px; }
main { padding: 20px 150px 20px 20px;
background-color: #ffffff;
color: #000000; }
</style>
</head>
<body>
<header role="banner">
<h1>Trillium Media Design</h1>
</header>
<nav role="navigation">
<ul>
```

```
<li><a href="index.html">Home</a></li>
<li><a href="services.html">Services</a></li>
<li><a href="contact.html">Contact</a></li>
</ul>
</nav>
<main role="main">
<p>Our professional staff takes pride in its working relationship with our clients by offering personalized services that listen to their needs, develop their target areas, and incorporate these items into a website that works.</p>
</main>
</body>
</html>
```

Web research

As you read about mobile web design best practices in this chapter, you may have noticed some overlap with techniques that provide for accessibility, such as alternate text and use of headings. Explore the Web Content Accessibility and Mobile Web document at *http://www.w3.org/WAI/mobile*. Explore related links that interest you. Write a one-page, double-spaced summary that describes areas of overlap and how web developers can support both accessibility and mobile devices.

Question 4 solution:

we have to make change in CSS code, we have to set the float to right for nav tag, so it becomes float: right; so we can display the navigation area on the right side of the window

```
x.html > html > head > style > main >
<!DOCTYPE html>
<html lang="en">
<head>
<title>Find the Error</title>
<meta charset="utf-8">
<style>
body { background-color: #d5edb3;
color: #000066;
font-family: Verdana, Arial, sans-serif; }
nav { float: right;   /* <---------------------------------------- */

width: 120px; }
main { padding: 20px 150px 20px 20px;
background-color: #ffffff;
color: #000000; }
</style>
</head>
<body>
<header role="banner">
<h1>Trillium Media Design</h1>
</header>
```

Mobile devices Accessibility and usability

The World Wide Web Consortium (W3C) ensures that mobile devices accessibility and usability are closed areas of concern that shares some values. In a way that certain features would be useful for both disabled and non-disabled individuals.

For instance, the Screen Reader on mobile phones and laptops really portrait this overlap between accessibility and usability, where people who are blind or suffering from sever visual impairments can use this tool to be able to navigate their mobile devices without seeing it as the reader reads out everything on the screen. Also, no-disabled Individuals finds this tool beneficial as they use it to listen for book or article while they are performing another task (Multitasking) or to reduce eye strain from excessive screen time. This feature is found on Android phones under the name of “TalkBack” ,on Apple iPhone as “VoiceOver”, and on Window Laptops it’s called “Microsoft Narrator”.

Regarding developers, they consider achieving accessibility and usability for any web content or mobile device they develop. They have to follow clear regulations defined in the Web Content Accessibility Guidelines (WCAG), where It guide them to create web content and applications that is accessible to users with low vision, hearing loss and cognitive limitations. As they focus on accessibility, they also consider the usability , so they work on building technology that has adaptive layout, flexible text and scalable design, to ensure that content works across device and for all users with different needs.
